2

PSD2 Exemptions and it's Opportunities

PSD 2 Exemptions = no SCA applied
Frictionless process, without challenge
Optional for use

Benefits
Reduce of abandonment rates
Provide seamless customer experience

How it works
Appropriate risk scoring is applied
No other exemption has been applied

Security at first place
Issuers can still reject the exemption,
even with met criteria

3

Which PSD2 Exemptions can be Used by Acquirers?

In scope of PSD2 RTS

Acquirer

Issuer

Low-value transactions

Transaction risk analysis

Recurring transactions

Trusted beneficiaries (Whitelisting)

Secure corporate payments

Delegated authentication

Out of scope

Anonymous prepaid cards

MOTO *

One-leg transactions

MIT **

* MOTO = Mail order / Telephone order
** MIT = Merchant initiated transaction

netcetera

4

4

Low Value Transactions

1

Transaction amount $\leq 30\text{€}$

AND

2

Σ (Transaction amounts since last SCA) $\leq 100\text{€}$
 OR
 N° (Transactions since last SCA) ≤ 5

Acquirers cannot correctly count the number of consecutive low value transactions nor the cumulative amount since the last SCA.
This can only be checked by the issuer during payment authorization.

netcetera

5

5

Transaction Risk Analysis (TRA)

1

Low level of risk
Risk assessment is mandatory!

2

Transaction amount $\leq \text{ETV}^*$
 (based on the Acquirer's fraud rate)

* ETV = Exemption threshold value

ETV (in €)	
> 500	Not applicable for TRA
$250 \leq 500$	1 bps = 0.01% (1 out of 10.000)
$100 \leq 250$	6 bps = 0.06% (6 out of 10.000)
≤ 100	13 bps = 0.13% (13 out of 10.000)

* for remote electronic card-based payments

Fraud reporting to National Competence Authority

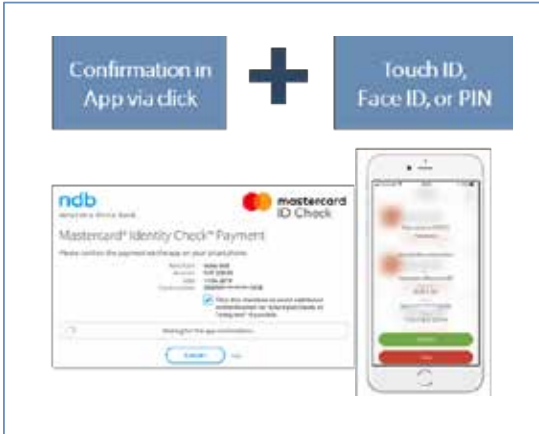

netcetera

6

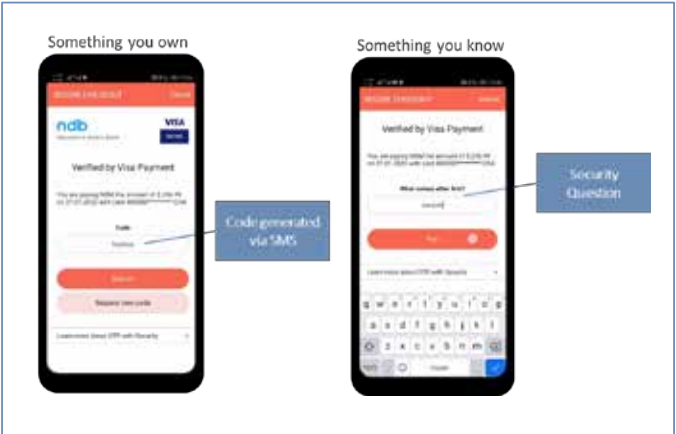

6

2FA Authentication provided by Netcetera 3DS solution

OOB – Out of Band

OTP – One Time Passcode

netcetera

7

Direct Authorization With Acquirer's Exemption

Acquirer

Acquirer's Exemptions

One exemption per transaction

Exemption Indicator →

← Accept / Soft Decline

Issuer

Authorization

When a transaction is soft declined, it must go to 3DS, even in case another exemption could be applied.
The schemes recommend Issuers to not systematically decline authorizations without authentications.

Conversion

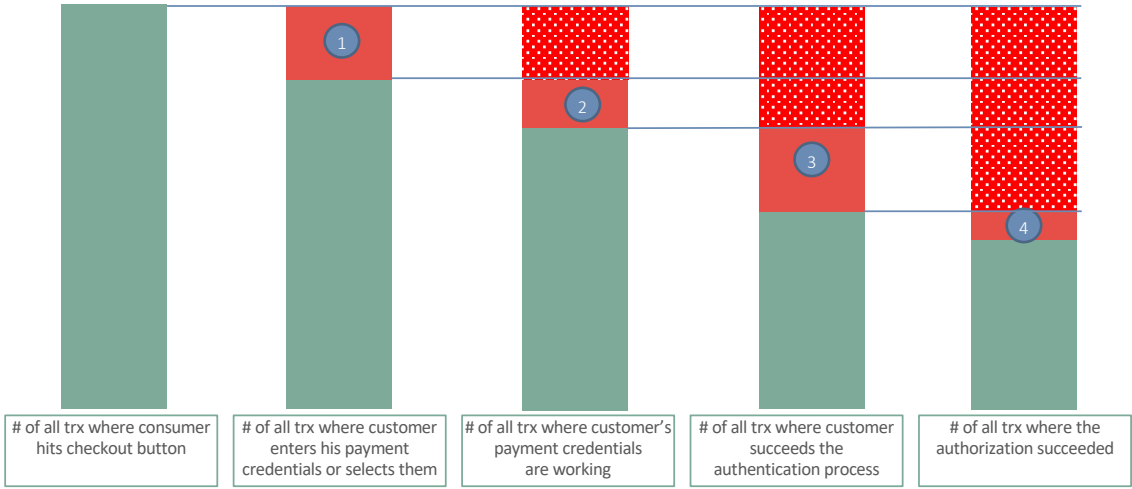

How can merchants and PSPs
measure their conversion ?

netcetera 9

9

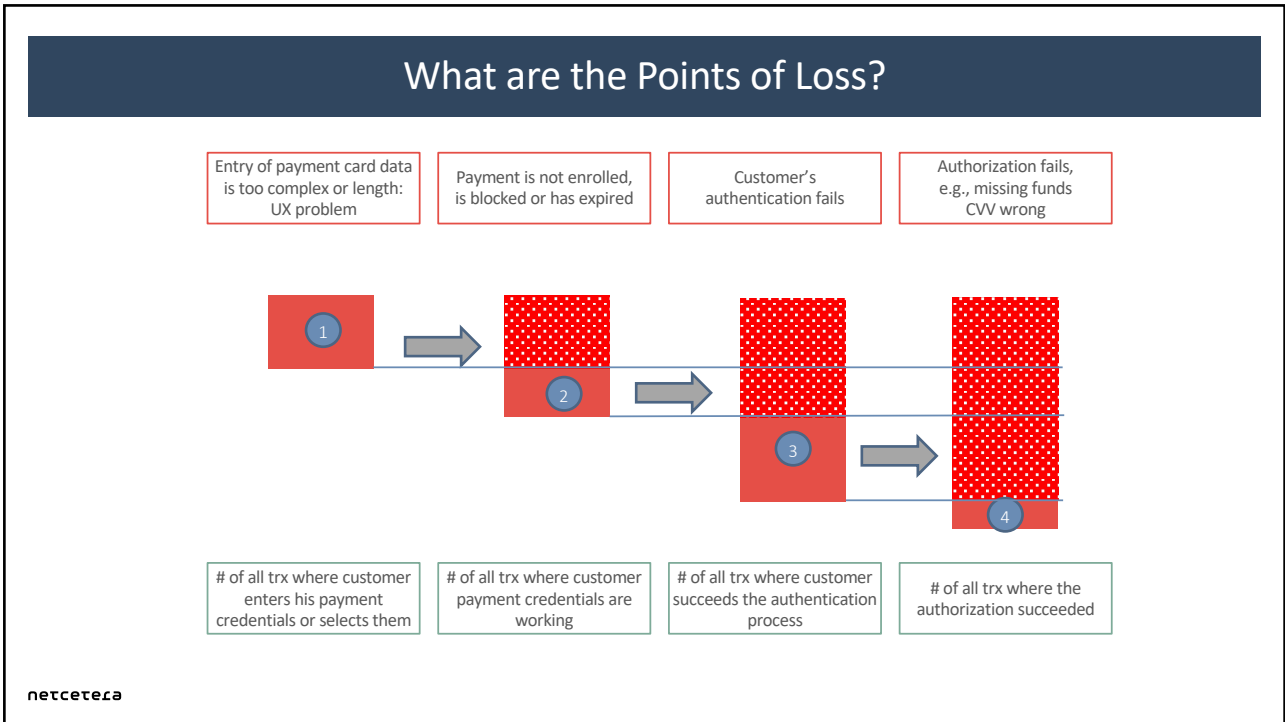

What is Conversion and how to Measure?

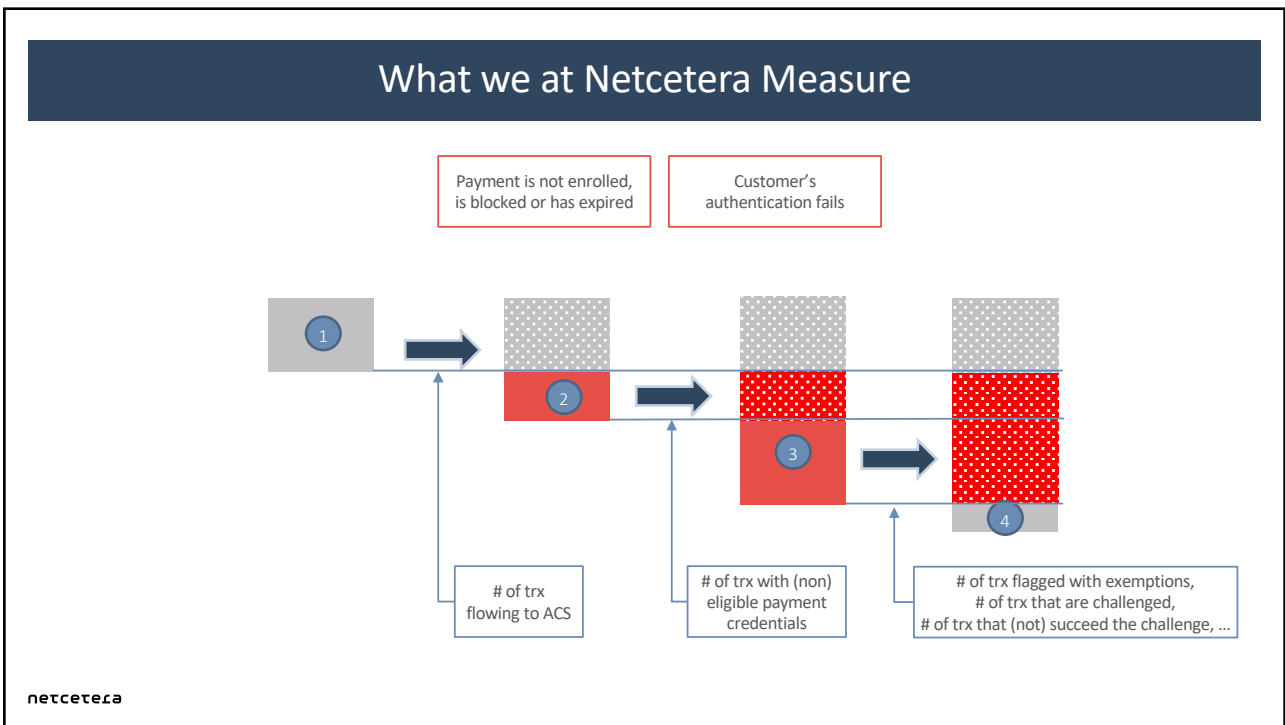

Stage	Description	Visual Representation
1	# of all trx where consumer hits checkout button	Full green bar
2	# of all trx where customer enters his payment credentials or selects them	Green bar with red segment 1
3	# of all trx where customer's payment credentials are working	Green bar with red segment 2 and red-dotted segment 1
4	# of all trx where customer succeeds the authentication process	Green bar with red segment 3, red-dotted segment 2, and red-dotted segment 2
5	# of all trx where the authorization succeeded	Green bar with red segment 4, red-dotted segment 3, red-dotted segment 2, and red-dotted segment 1

12

13

How did we Measure?

We took data from our ACS at selected dates (same weekdays) at selected hours in the afternoon, so looking into ~ 2,5 mil datapoints with each around 50 attributes = 120 Mio fields

Data extracted monthly from July to Dec 2020 and then around weekly intervals starting 2021.

We have excluded transactions outside of EEA, both from issuer side but also from merchant side (so not considering one-leg or even two-legs out)

We have excluded any test and non-payment transactions (excluded transactions with 0 amount)

We have written a Python program to do the math and generate appropriate queries and tables

14

Card not enrolled / blocked

In average only 91% of cards are enrolled

The best issuer has only 0,5% of not enrolled cards. So, by proper onboarding and supporting of all challenge methods, the rate can be increased

In average 2,8% of cards are locked

Total conversion loss is
~ 12%
(not enrolled, deleted, locked...)

15

15

AAR = Authentication Approval Rate

In average around 82% of all trxs are approved in the 3DS process

Trend for conversion slightly decreasing

Conversion

Date	Conversion Rate
2007.07.01	84.0%
2008.08.05	83.5%
2009.09.02	76.0%
2010.10.07	82.5%
2011.11.04	84.5%
2012.12.09	83.0%
2013.12.16	82.5%
2014.12.23	81.5%
2015.12.30	81.0%
2016.01.06	80.5%
2016.01.27	80.0%
2017.02.03	80.5%
2017.02.10	80.5%
2017.02.17	80.5%
2017.02.24	80.5%
2017.03.03	80.5%
2017.03.10	80.0%
2017.03.17	80.0%

16

16

The share of the EMV 3DS transactions is increasing

Protocol version share and Success Rate

The volume of V2.1 transactions has significantly increased

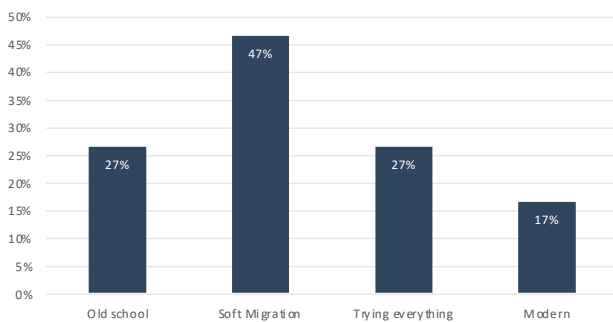

V2.2 transactions starting to appear, but their Success Rate is not stable

netcetera

17

Protocols used by the merchants

Distribution of merchants per type

Old school Merchants
sending only 3DS V1.0 messages

Soft Migration Merchants
decrease of the 3DS 1 processed # of messages
increase of EMV® 3DS 2.x processed # of messages

Trying Everything Merchants
send messages with both protocol versions

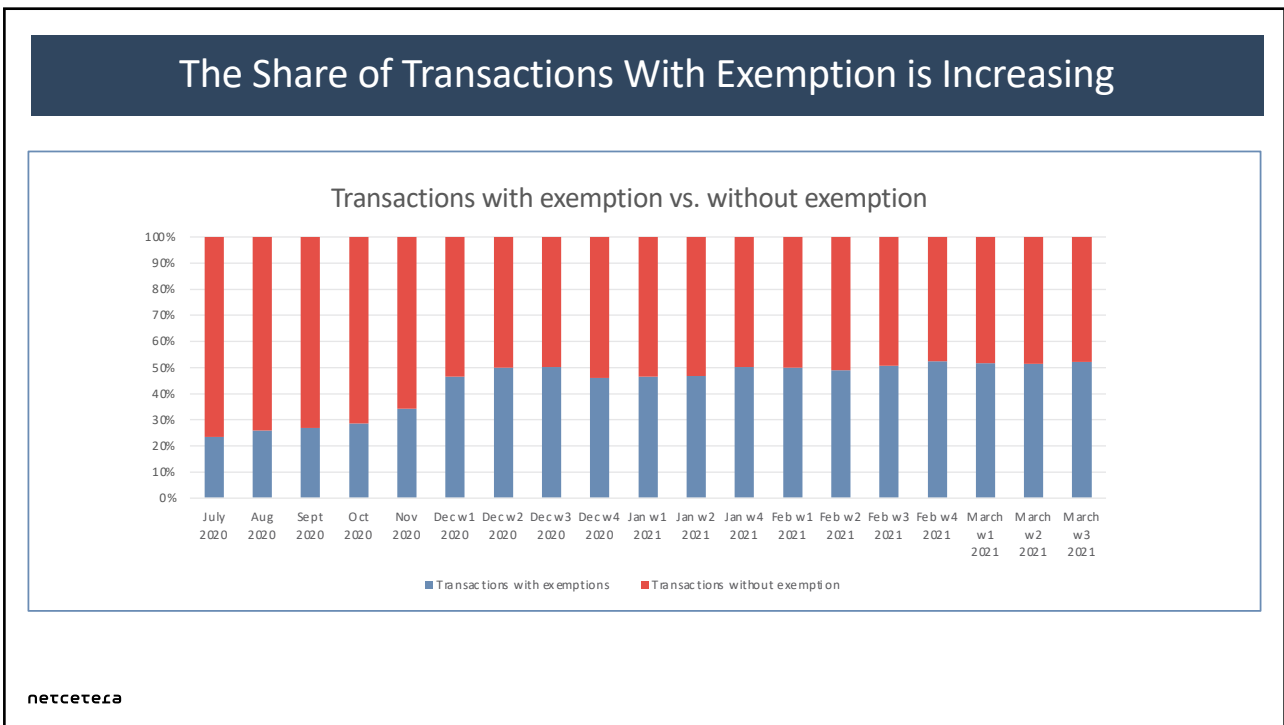

Modern Merchants
send only EMV 3DS messages

netcetera

18

19

20

Most of the Exempted Transactions use TRA

netcetera

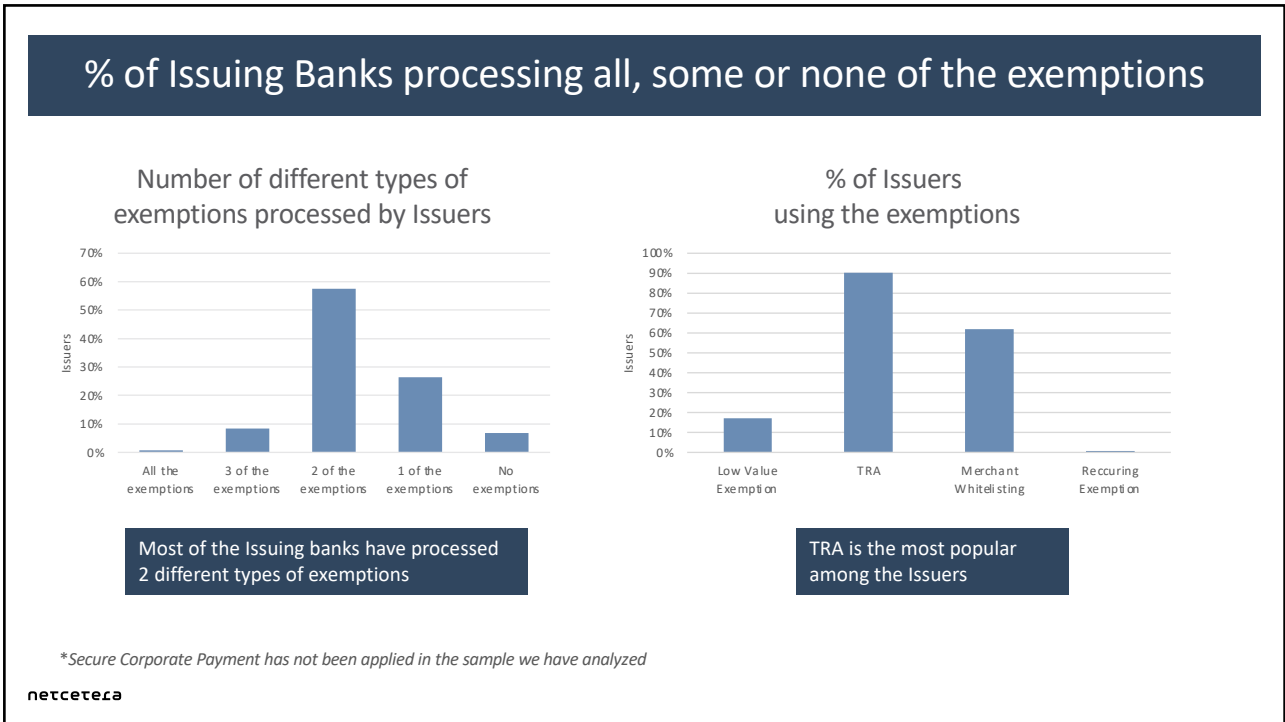

21

In which amount range the exemptions are applied

28

Summary & Recommendation

Communication to cardholders is key to help them to adopt the SCA methods (OOB, OTP)

Cooperation between all parties (three domains) will help solving the interoperability issues

Testing, Testing, Testing
(see also <https://3dss.netcetera.com/mastercard-psd2-testing/>)

EMV 3DS on mobile channel still problematic, although it should be superior in theory as it is in infant status

Proper use of PSD2 exemptions help in decrease the abandonment rate and in improve of the customer's experience (seamless - one click payments)
